

Extending BioSum to optimize multi-decade forest restoration and evaluate biochar facility feasibility in the Upper Klamath Basin

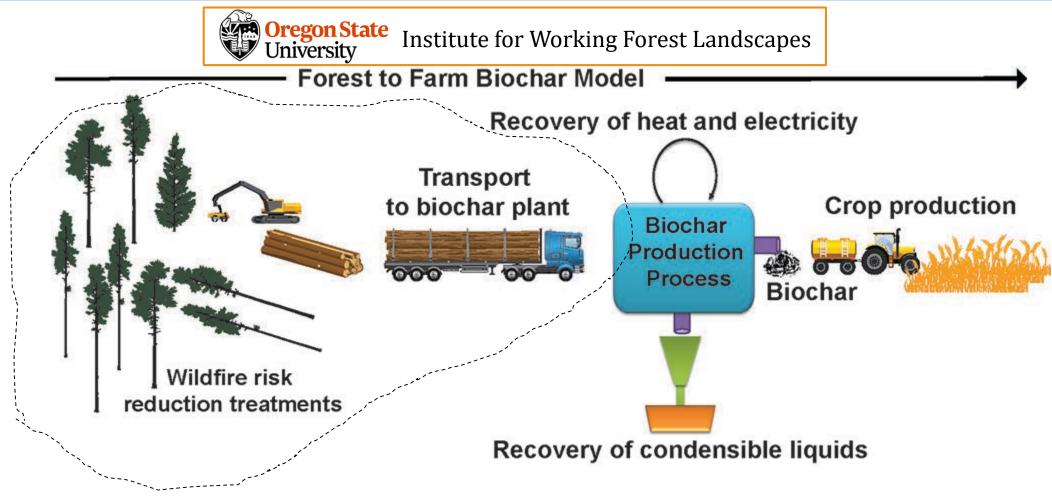

#### November 21, 2019

<sup>1</sup> USDA FS PNW FIA

- <sup>2</sup> Mendocino Redwood Co.
- <sup>3</sup> Oregon State University

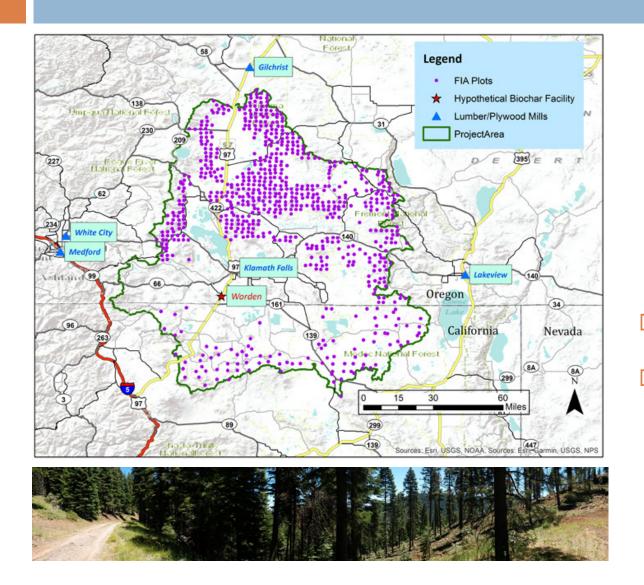

Opportunities for Biochar Production to Reduce Forest Wildfire Hazard, Sequester Carbon, and Increase Agricultural Productivity of Dryland Soils

Relied on BioSum + Customization to characterize the Biochar feedstock

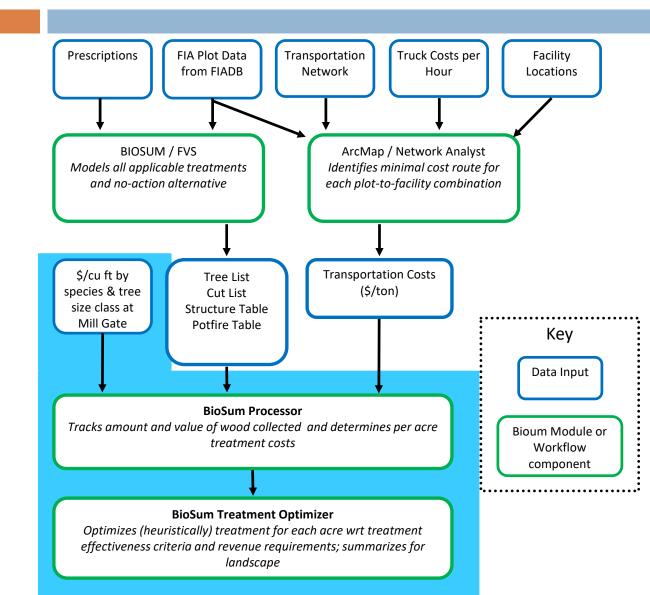

# Upper Klamath Basin: Biochar feedstock analysis

 730 plots on 1.9 million NFS acres
 Modeled with BioSum, customized via publicly posted Python scripts, to merchandise logs and optimize harvest scheduling with even flow and break-even requirements

# Standard BioSum version 5.8.7

#### Advantages

- Proven, automated workflow
- Easy to change problem definition, assumptions & rerun
- Retains all intermediate calcs

#### Limitations

- "Biomass" def'n hard coded as all nonmerch, including tops, limbs
- Biochar: bolewood to a four inch DIB top, with a minimum length of eight feet, so typically a portion of top, or whole bole of non-commercial species
- No harvest scheduling component

Tethered, CTL

- □ Limbs → brush mat
- □ Tops, small trees, and noncommercial species → biochar feedstock

## Fire resistance scoring: $\sum \text{subscores} \rightarrow \text{Composite Resistance Score}^1 \text{ of } 0-12$

Component	Canopy Bulk Density	Fuel Strata Gap	Resistant Species as	FOFEM Survival
Score	(kg/m³)	(feet)	a percent of BA	as a % of volume
0	> 0.15	≤ 7	≤ 25	≤ 2
1	0.11 to 0.15	7 to 20	25 to 50	2 to 30
2	0.051 to 0.10	20 to 30	50 to 75	30 to 75
CRS ca	lculațea at each	n 5-yr cycle break	75 to 100	> 75

- EXPCURR devolved into 100 ac subunits
- $\square$  Max  $\sum_{period=1}^{5} AreaWt'd CRS$

<sup>1</sup> Jain, Fried and Loreno. Forthcoming in Forest Science. Simulating the effectiveness of improvement cuts and commercial thinning to enhance fire resistance in west coast dry mixed conifer forests.

# Assumptions for grow-only, burned at landing (BAL), utilized as biochar (UAB) and unconstrained (UNC) scenarios

Scenario label	Feedstock disposition	Annual area	Management Return
		treated (ac.)	Interval (yrs.)
G-O	NA- grow-only	0	NA
MRI-100 BAL	Burned at landing	19,000	100
MRI-100 UAB	Utilized as biochar	19,000	100
MRI-50 BAL	Burned at landing	38,000	50
MRI-50 UAB	Utilized as biochar	38,000	50
MRI-25 BAL	Burned at landing	76,000	25
MRI-25 UAB	Utilized as biochar	76,000	25

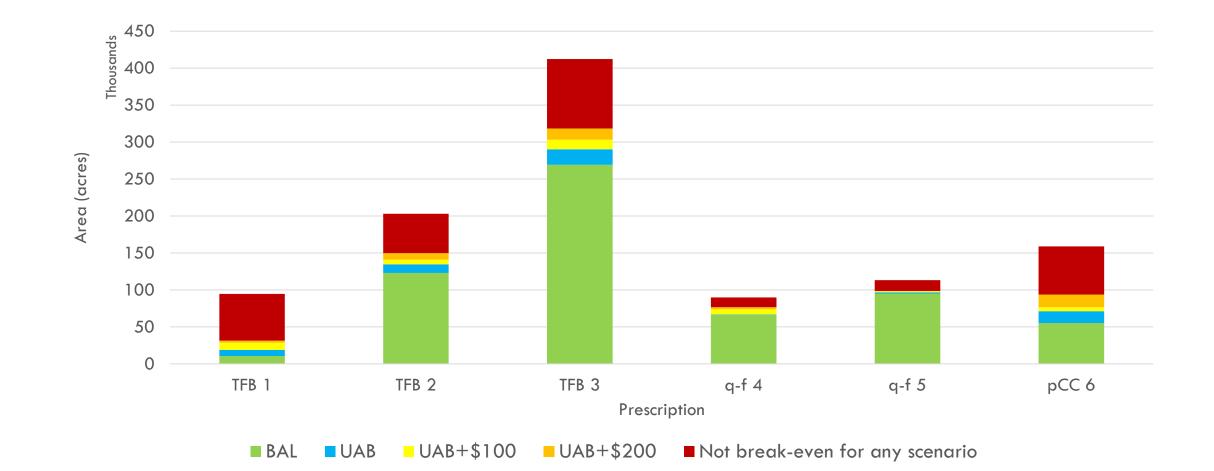

## Immediate score change relative to grow-only **Oregon State** when implemented at year 1

		Average score change at year 1								
		Sub-score								
		Canopy Bulk	Resistant		Composite					
Treatment	Fuel Strata Gap	Density	Species	Survival	Resistance Score					
TFB 1	1.15	0.91	0.17	0.30	2.53					
TFB 2	1.04	1.18	0.34	0.43	2.98					
TFB 3	0.87	1.19	0.39	0.38	2.83					
q-f 4	0.66	1.42	0.25	0.25	2.57					
q-f 5	0.70	1.26	0.36	0.24	2.56					
	0.24	0.70	2.40	1.24	4.01					

#### Area eligible for treatment & frequency with which treatment at $rac{1}{2}$ yr 16 (4<sup>th</sup> period) $\rightarrow$ increase, no change or decrease in CRS

	Eligible area			
Treatment	(thousand acres)	% where CRS increased	% with no change in CRS	% where CRS decreased
TFB 1	129.0	91	9	0
TFB 2	260.1	94	5	1
TFB 3	509.4	91	9	0
q-f 4	177.7	86	14	0
q-f 5	193.4	93	7	0
pCC 6	284.5	98	1	1

## Eligible area achieving break-even, with feedstock used as biochar (UAB), by scenario and prescription

Mean CRS by representative year, sum over all 5 years, and sum expressed as a percent of maximum possible CRS

Scenario	Year 1	Year 6	Year 11	Year 16	Year 20	Sum of scores	Pct. of Max
G-O	6.84	6.91	6.98	6.98	7.00	34.64	58%
MRI-100	7.15	7.60	8.03	8.52	8.54	39.83	66%
MRI-50	7.45	8.47	9.38	10.19	10.21	45.69	76%
MRI-25	7.55	8.78	9.61	10.34	10.36	46.65	78%
UNC	9.06	10.02	10.41	10.66	10.67	50.82	85%

The BAL and UAB scenarios produced identical results for a given capacity constraint so only one set of results is reported per MRI.

Mean annual <u>net revenue</u> (million dollars) from sales of wood, less treatment and haul costs, and total present net value over 20-yr simulation

Scenario	Period 1	Period 2	Period 3	Period 4	20-yr PNV <sup>1</sup>
G-O	0	0	0	0	0
MRI-100 BAL	30.9	21.9	18.1	17.6	351.7
MRI-100 UAB	33.1	23.6	20.3	19.7	383.1
MRI-50 BAL	41.5	21.8	24.3	32.1	466.9
MRI-50 UAB	45.6	25.7	28.4	35.9	528.1
MRI-25 BAL	47.6	22.8	27.8	34.8	520.2
MRI-25 UAB	52.2	27.9	31.6	38.7	587.8
<sup>1</sup> at discount rate of	3%				

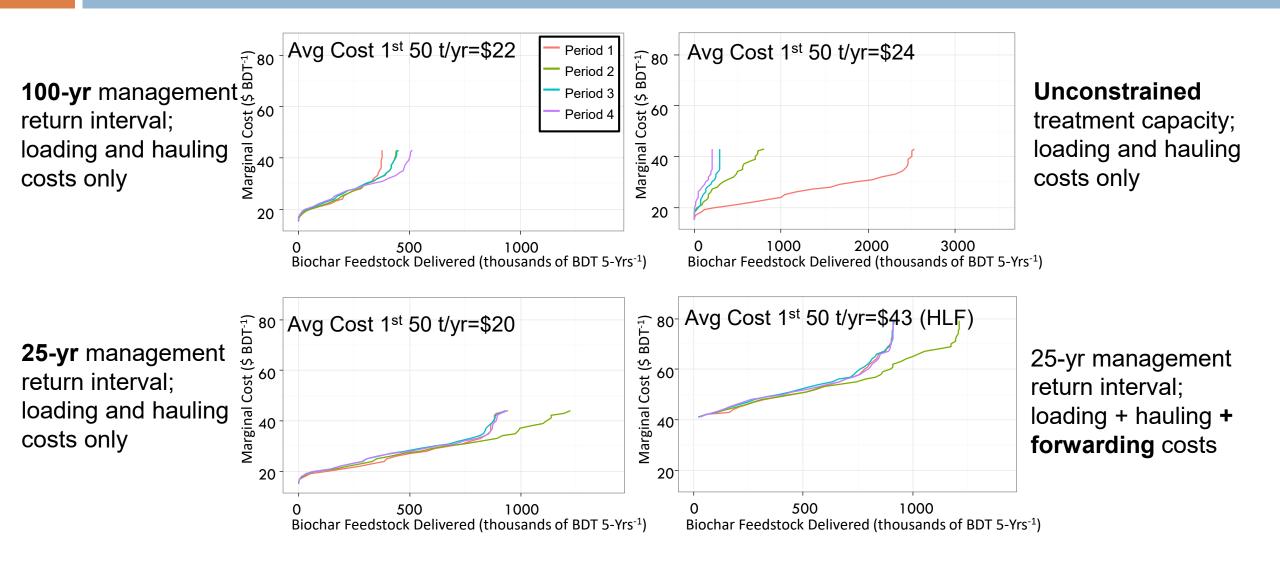

# Annual wood production

Scenario Period 1		Period 2	Period 3	Period 4	20-yr yield
		Sawlogs (t	housand BDT)		
MRI-100	334	287	273	286	5,897
MRI-50	MRI-50 522		450	530	9,562
MRI-25 583		498	506	576	10,820
UNC	1465	284 160		148	10,291
	Bioc	har feedstock So	awlogs (thousa	nd BDT)	
MRI-100	76	91	91	104	1,810
MRI-50	165	198	188	185	3,687
MRI-25	188	244	186	187	4,025

Marginal cost at Worden, per 5-yr period, as a function of biochar feedstock produced from the Upper Klamath

- □ BioSum good for testing Rxs and sifting through management scenarios
- ...and for developing supply curves
- □ Modular design allows for even greater customization by the motivated
- More info at:
